

- High Quality Fresh Algae Species
- UK Grown on Organic Sourced Nutrients
- Harvested, Washed and Screened
- No Excess Nutrients to Foul Your Tanks!

Fresh Live Algae Concentrates

PhytoPilot produces high quality species of algae for your aquaria. Our phytoplankton species are highly nutritious and packed with fatty acids, dyes and essential minerals providing your aquaria occupants with a feed that is closer to their natural diet. Balanced blends of species provide a perfect diet for every living organism. All our phytoplankton products are washed and screened to ensure no unwanted organisms.

Chlorella vulgaris, Nannochloropsis oculata
Phaeodactylum tricornutum, Tetraselmis chuii
1x, 16x, 32x and 50x concentrates in bottles or bulk
30-40g/l salinity, 5-50µm algae size

Our phytoplankton are hand reared here at PhytoPilot. In indoor tanks, we ensure that you get the best feed you need. Our algae are naturally high in a mixed range of fatty acids, omega 3-6, dyes, vitamins and nutrition. We carefully harvest and screen our algae and after harvesting all our concentrates are carefully washed and then resuspended in nutrient-free salt water. We believe in 'peak' nutrition and harvest our algae during the best phase during their growth to ensure maximum nutrition. No old cultures here - we grow and harvest to order.

We concentrate on 4 core species to give a strong nutritional profile to our blends. The species are good growers we can depend upon all year round to give high density concentrates and be effective feeds. We believe in our concentrates so much we use them to feed our own microorganisms meaning they are full of premium nutrition for higher organisms.

They can stink! Did you know that fresh Phaeodactylum can smell of baked beans and Tetraselmis smells like raw meat!

How to care for your product: When you first receive your algae, give the container a good shake and let the air circulate. When stored, algae can be a bit smelly, but this is only natural. Stored algae will produce sulphides to help them survive for longer. Algae is best kept in a cool place or ideally stored in the fridge.

PhytoPilot inspired by Cwm Harry are producers of high quality algae concentrates and microorganisms. We provide live, high quality products to give a pure and natural food. We don't use preservatives and we harvest at peak-nutritional value. To find out more, contact your supplier!
